

Predicting life expectancy

Project supervised machine learning, 2nd October 2019

Filipa Lopes

Motivation

- Insurance companies
- Retirement provision

10 Predictors

Target: life expectancy

(~2000 entries)

Your:

- yearly income*
- CO₂ emissions (tones/person)
- total spending in healthcare*
- Allowance/ government spending in your healthcare*
- food consumption (calories/day)
- sugar consumption (grams/day)
- schooling (years spent on school + university)
- alcohol consumption
- body mass index (BMI)
- fertility (number of children)

*(US\$, inflation-adjusted)

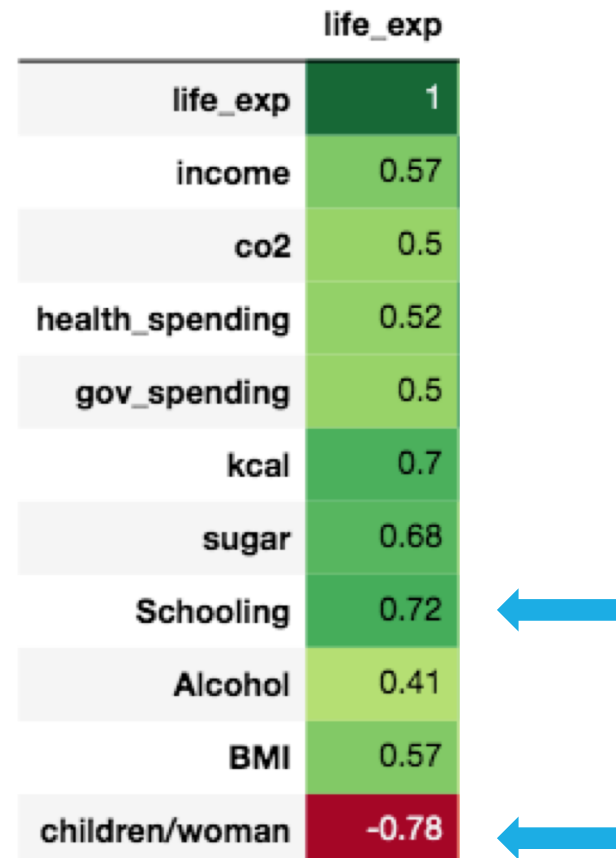

Data

- 187 countries, from 2000 till 2010
- ~2000 entries
- Sources: World Health Organization(Kaggle) and gapminder.org

What are the best predictors for life expectancy?

Correlation heatmap

	life_exp
life_exp	1
income	0.57
co2	0.5
health_spending	0.52
gov_spending	0.5
kcal	0.7
sugar	0.68
Schooling	0.72
Alcohol	0.41
BMI	0.57
children/woman	-0.78

Models

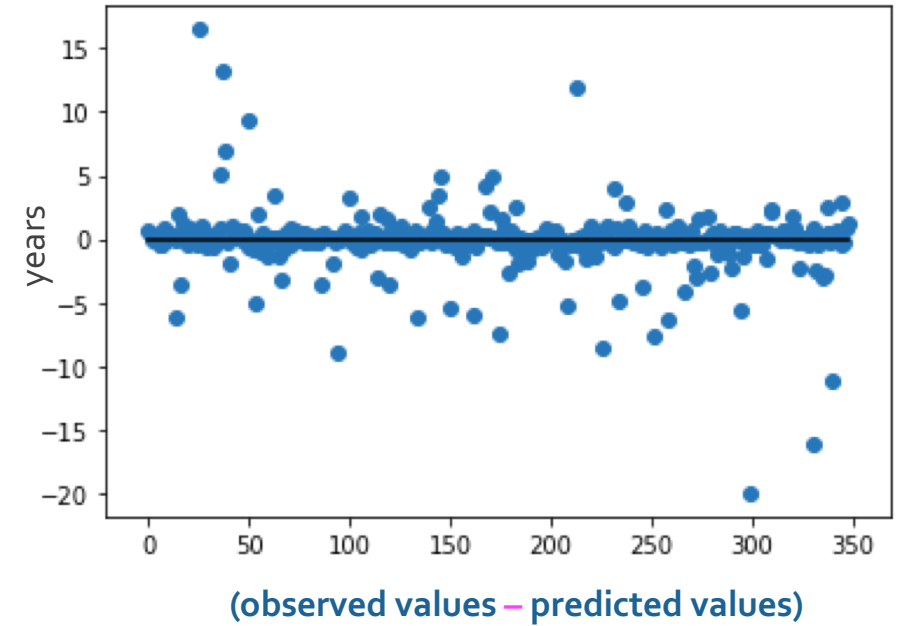

Test accuracy

- Linear Regression model: 76.64%
- KNeighbors (neighbors=3): 72.04%%
- **Decision Tree model: 91.33%**

Evaluation of model

How much the model does not match?

Real case scenario

Conclusion (<http://filipamiralopes.pythonanywhere.com>)
